For a third course in my major that I felt helped me learn a lot about a certain area of Information Technology from a particular assignment, that would be IT-1008-1 Intro Computer Sci with a Capstone Project I did.

For what this specific project was that I did with what it involved doing, that would be creating a program for your Scribbler Robot to have it traverse a maze that the professor provided that had certain rules for specific areas of it along the way and for how I did it, that would be that I created four different programs for two exercises where I followed all of the rules for both with recording each of them and submitting all of the programs, videos, and instructions for everything where I then presented it all to the class of that of my finished capstone.

For what I ended up learning from this assignment project, that would be how to create a program to accomplish a task with following certain rules along the way in doing it a certain specific way for the path of following a maze.
